Background

The data for for hands-on session comes from GEO entry: GSE37704, which is associated with the following publication:

Trapnell C, Hendrickson DG, Sauvageau M, Goff L et al. "Differential analysis of gene regulation at transcript resolution with RNA-seq". Nat Biotechnol 2013 Jan;31(1):46-53. PMID: 23222703

The authors report on differential analysis of lung fibroblasts in response to loss of the developmental transcription factor HOXA1. Their results and others indicate that HOXA1 is required for lung fibroblast and HeLa cell cycle progression. In particular their analysis show that "loss of HOXA1 results in significant expression level changes in thousands of individual transcripts, along with isoform switching events in key regulators of the cell cycle". For our session we have used their Sailfish gene-level estimated counts and hence are restricted to protein-coding genes only.

Data Import

```
metaFile <- "GSE37704_metadata.csv"</pre>
countFile <- "GSE37704_featurecounts.csv"</pre>
# Import metadata and take a peak
colData <- read.csv(metaFile, row.names = 1)</pre>
head(colData)
               condition
SRR493366 control_sirna
SRR493367 control_sirna
SRR493368 control_sirna
SRR493369
                hoxa1_kd
SRR493370
                hoxa1_kd
                hoxa1_kd
SRR493371
# Import countdata
countData = read.csv(countFile, row.names = 1)
head(countData)
```

```
length SRR493366 SRR493367 SRR493368 SRR493369 SRR493370 ENSG00000186092 918 0 0 0 0 0 0
```

ENSG00000279928	718	0	0	0	0	0
ENSG00000279457	1982	23	28	29	29	28
ENSG00000278566	939	0	0	0	0	0

	SRR493371					
ENSG00000186092	0					
ENSG00000279928	0					
ENSG00000279457	46					
ENSG00000278566	0					
ENSG00000273547	0					
ENSG00000187634	258					

Inspect and Tidy Data

Does the counts columns math the colData rows?

```
rownames(colData)
```

[1] "SRR493366" "SRR493367" "SRR493368" "SRR493369" "SRR493370" "SRR493371"

```
colData$id <- rownames(colData)</pre>
```

colnames(counts)

 \mathtt{NULL}

The fix here looks to be removing the first "length" column from counts

Q1. Complete the code below to remove the troublesome first column from count- Data

```
countData <- as.matrix(countData[,-1])
head(countData)</pre>
```

	SRR493366	SRR493367	SRR493368	SRR493369	SRR493370	SRR493371
ENSG00000186092	0	0	0	0	0	0
ENSG00000279928	0	0	0	0	0	0
ENSG00000279457	23	28	29	29	28	46
ENSG00000278566	0	0	0	0	0	0
ENSG00000273547	0	0	0	0	0	0
ENSG00000187634	124	123	205	207	212	258

Q2. Complete the code below to filter countData to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns). Tip: What will rowSums() of countData return and how could you use it in this context?

```
# Filter count data where you have 0 read count across all samples.
countData = countData[rowSums(countData[])>0, ]
head(countData)
```

	SRR493366	SRR493367	SRR493368	SRR493369	SRR493370	SRR493371
ENSG00000279457	23	28	29	29	28	46
ENSG00000187634	124	123	205	207	212	258
ENSG00000188976	1637	1831	2383	1226	1326	1504
ENSG00000187961	120	153	180	236	255	357
ENSG00000187583	24	48	65	44	48	64
ENSG00000187642	4	9	16	14	16	16

Check for matching contDat and colData

```
identical(colnames(countData), colData$id)
```

[1] TRUE

4

Setup for DESeq

```
#/ message: false
library(DESeq2)
```

Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in design formula are characters, converting to factors

```
estimating size factors
estimating dispersions
gene-wise dispersion estimates
mean-dispersion relationship
final dispersion estimates
fitting model and testing
```

dds = DESeq(dds)

Run DESeq

```
res = results(dds, contrast=c("condition", "hoxa1_kd", "control_sirna"))
```

head(res)

log2 fold change (MLE): condition hoxa1_kd vs control_sirna

ENSG00000187642 4.03379e-01

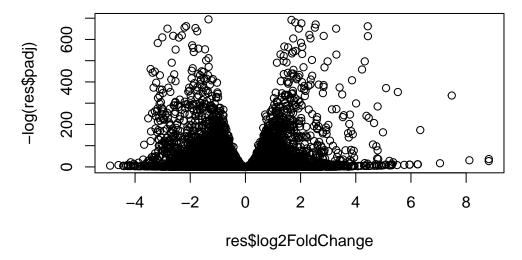

Q3. Call the summary() function on your results to get a sense of how many genes are up or down-regulated at the default 0.1 p-value cutoff.

summary(res)

```
out of 15975 with nonzero total read count
adjusted p-value < 0.1
LFC > 0 (up) : 4349, 27%
LFC < 0 (down) : 4396, 28%
outliers [1] : 0, 0%
low counts [2] : 1237, 7.7%
(mean count < 0)
[1] see 'cooksCutoff' argument of ?results
[2] see 'independentFiltering' argument of ?results</pre>
```

Volcano Plot of Results

```
library(ggplot2)
plot( res$log2FoldChange, -log(res$padj) )
```

Q4. Improve this plot by completing the below code, which adds color and axis labels

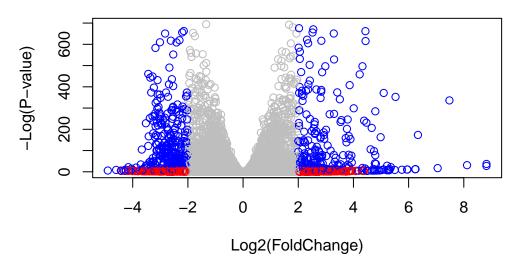

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

# Color blue those with adjusted p-value less than 0.01

# and absolute fold change more than 2
inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

plot( res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(P-vector)")</pre>
```

Gene Annotation

Q5. Use the mapIDs() function multiple times to add SYMBOL, ENTREZID and GENENAME annotation to our results by completing the code below.

```
library("AnnotationDbi")
library("org.Hs.eg.db")
```

```
columns(org.Hs.eg.db)
```

```
[1] "ACCNUM"
                    "ALIAS"
                                   "ENSEMBL"
                                                  "ENSEMBLPROT"
                                                                "ENSEMBLTRANS"

```

Q6. Finally for this section let's reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

```
res = res[order(res$pvalue),]
write.csv(res, file = "deseq_results.csv")
```

Pathway Analysis

```

Q7.Can you do the same procedure as above to plot the pathview figures for the top 5 down-reguled pathways?

Yes, the same procedure can be applied; however, some adjustments are necessary for down-regulated pathways. Specifically, in the gage() function, the parameter same.dir should be changed from TRUE to FALSE to correctly identify and visualize downregulated pathways.

Gene Ontology Analysis

```
data(go.sets.hs)
data(go.subs.hs)

# Focus on Biological Process subset of GO
gobpsets = go.sets.hs[go.subs.hs$BP]

gobpres = gage(foldchanges, gsets=gobpsets, same.dir=TRUE)

head(gobpres$less)

print(paste("Total number of significant genes:", length(sig_genes)))</pre>
```

[1] "Total number of significant genes: 8147"

```
write.table(sig_genes, file="significant_genes.txt", row.names=FALSE, col.names=FALSE, quote
```

Q8. What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods?

The pathway with the most significant "Entities p-value" is the Endosomal/Vacuolar pathway. However, this pathway does not match the most significant pathway identified in my previous KEGG results.

One possible explanation for this discrepancy is that the Reactome analysis identified 2,945 entities that were not found in the KEGG analysis, potentially affecting the results. Additionally, methodological differences between Gene Ontology and KEGG pathway analysis may contribute to variations in the identified pathways.
